1.0 INTRODUCTION

Road Surface Management System (RSMS) is a methodology intended to provide an overview and estimate of a road system's condition and the approximate costs for future improvements. RSMS provides a systematic approach for local officials to answer basic questions about their road system, to gauge current network conditions and to guide future improvement and investment in line with municipal Capital Improvement Programs. The RSMS program provides information on the condition, traffic, and importance of roads in a town to create a long term maintenance program.

The two most commonly used RSMS applications to manage roads in New Hampshire are RSMS 11, created by Maine Local Roads Center, as well as an RSMS tool created jointly by PWS Solutions and the University of New Hampshire Technology Transfer Center (UNHT2). However, not all municipalities had familiarity with the systems and RSMS practices were generally used less by New Hampshire's smaller communities.

In 2015-2016, New Hampshire Department of Transportation (NH DOT) partnered with the UNHT2 and all nine regional planning commissions (RPCs) in the State to update the RSMS platform while simultaneously developing a larger base of regional training capacity to introduce more municipalities to the asset management program. This effort began with an RSMS pilot program in each regional planning district in the State, called SADES RSMS or SRSMS.

The Nashua Regional Planning Commission (NRPC) participated in the pilot study and partnered with the Town of Brookline, which is a member of the NRPC planning community.

2.0 PROJECT SCOPE & TIME LINE

The project began by conducting an inventory of pavement conditions on paved Class V roads, followed by the production of maps, and pavement management scenario planning. Project deliverables included maps of pavement condition, the development of a road segment priority list based on traffic and importance and one (1) 10-year maintenance plan scenario. The project schedule is shown here:

- NRPC held kickoff meeting with Brookline Town officials
- NRPC collected road surface data, the location of culverts, and performed quality checks on condition assessment information in partnership with UNHT2
- NRPC created condition maps of various pavement distresses as well as overall pavement condition.

- NRPC conducted scenario planning, management strategies, costs and benefits.
- NRPC finalized reports, maps, and a pavement management scenario

3.0 BENEFITS OF DEVELOPING A PAVEMENT MANAGEMENT PLAN

The process of creating this pavement management plan included putting together an inventory of all paved roads in Brookline, assessing the conditions of those roads and then analyzing this information. The information will benefit Brookline in ways that are explained below.

A. INVENTORY OF PAVED ROADS

Many municipalities simply need to know what the road network consists of in terms of pavement structure and location. The software associated with this plan allows town officials to easily produce a simple list of all paved roads in Brookline, along with associated attributes such as road width, shoulder width, type of shoulder and other attributes.

B. PRIORITIZING MAINTENANCE NEEDS

This pavement management plan provides a prioritized list of maintenance needs for the road system in Brookline and therefore an objective way of prioritizing maintenance projects when existing resources are insufficient to meet all needs.

C. JUSTIFYING MAINTENANCE BUDGET INCREASES

Town administration and other officials will find it helpful to have an objective means of portraying maintenance needs to elected officials and voters and to be able to forecast the consequences of deferred maintenance both in terms of future costs and future pavement conditions.

D. MAKING EFFICIENT USE OF THE TOWN'S HIGHWAY BUDGET

It has been well documented that for about 75 percent of a pavement's life, its serviceability and its cost of maintenance is less than one-fifth of the cost of maintaining/rehabilitating a pavement which has been allowed to enter the rapid deterioration stage of the last quarter of its design life. The "art" of good maintenance management is in knowing when a pavement has reached that critical 75 percent point. Each pavement deteriorates differently depending upon climate, type and volume of traffic, drainage, and many other variables, and often if a pavement is allowed to deteriorate to a point of serious visible distress, it is beyond the critical cost point. A pavement maintenance management system helps a Road Agent track this kind of deterioration for many sections of pavement. Further, after critical pavements have been identified, the pavement management system will help the Road Agent select cost effective maintenance strategies based on the rate of deterioration and the expected life of a particular maintenance strategy.

Figure 1 (below) shows how the need for maintenance and repair is affected over time. The cost for maintenance and repair of roads which are repaired within the first 75 percent of the service life (within the 40 percent quality drop, fair to very good) is one-fourth to one-fifth the cost of maintenance and repair of roads that have deteriorated beyond the 75 percent mark. As shown in Figure 1, roads deteriorate at a faster rate beyond 75 percent of the service life. Roads experience a 40 percent drop in quality after 75 percent of the service life has passed; however, roads experience an additional 40 percent drop in quality soon after passing the 75 percent mark.

FIGURE 1: PAVEMENT DETERIORATION**E PAVEMENT PRESERVATION AND MAINTENANCE CONCEPTS**

RSMS tools offer a finite number of repair options, generally in the following key categories:

Preservation**Rehabilitation****Reconstruction**

Preservation consists of work that is planned and performed to improve or sustain the condition of a road segment that's already in a state of good repair. Preservation activities generally do not add capacity or structural value, but do restore the overall condition of the transportation facility. Preservation treatments are generally non-structural applications that preserve the surface and are designed to extend pavement life. The treatments can range from crack sealing to the application of thin overlays. Preservation is a proactive approach that can reap considerable cost savings because preservation strategies generally cost a fraction of rehabilitation or reconstruction projects.

Rehabilitation is generally considered to be a major repair, often an asphalt overlay following a surface preparation like a hot mix asphalt shim. Rehabilitation is more expensive than either maintenance or preservation, but less expensive than reconstruction.

Reconstruction, the most costly repair option, involves excavation and modification of the existing road base with additional aggregate as well as a new paved surface. This level of repair is usually required following inadequate maintenance, poor drainage, or improper base materials. Reconstruction, such as full-depth reclamation, is much more costly than other repair options.

4.0 INVENTORY INFORMATION

The Brookline Road Agent supplied information on roads maintained by the Town. The information was then incorporated into the UNHT2 database. Only Town maintained (Class V) paved roads were inventoried for this plan. Local unpaved and Class VI roads and state maintained roads were not included in this plan.

5.0 EVALUATION OF EXISTING ROADWAY CONDITIONS

With assistance from the Road Agent, NRPC performed an assessment of the Town's road surface conditions in the summer and fall of 2015. The road surface assessment was an essential input to the RSMS software and scenario planning. NRPC staff conducted windshield surveys on approximately 50 miles of Class V paved roads, which were subdivided into segments of approximately one-quarter mile in length, as a way to provide flexibility in evaluating differing maintenance treatments segment by segment later on in the RSMS process.

The information for each segment was uploaded to the UNHT2 "cloud" database from the field immediately after each segment was surveyed.

Roadway surface distresses were described based on eight category types for paved roads. The road surface conditions were recorded based on the severity of each distress, which refers to the degree of the category type, and the extent of each distress, which refers to the frequency of the occurrence or the amount of the road surface subjected to a particular distress. The types of distresses are as follows:

FIGURE 2: PAVEMENT STRESSES THAT WERE EVALUATED

Longitudinal or Transverse Cracking	Severity (No Defects, Low, Medium, High)
	Extent (Low, Medium, High)
Alligator Cracking	Severity (No Defects, Low, Medium, High)
	Extent (Low, Medium, High)
Edge Cracking	Severity (No Defects, Low, Medium, High)
	Extent (Low, Medium, High)
Patching or Potholes	Extent (No Defects, Low, Medium, High)
Drainage	Condition (Good, Fair, Poor)
Rutting	Severity (No Defects, Low, Medium, High)
	Extent (Low, Medium, High)
Roughness	Condition (Smooth, Noticeably Uneven, Rough, Very Rough)
Frost Heave Severity	Severity (None, Low, Medium, Severe)

6.0 RSMS SOFTWARE & PAVEMENT CONDITON INDEX

The RSMS software uses inventory information and field data to assign an overall rating of pavement condition that is referred to as the pavement condition index (PCI). Roads scored with a PCI of greater than 80 are considered “good”. Roads with a PCI less than 50 are considered “poor”. All other values are considered to be in “fair” condition. According to the PCI, the majority of Brookline’s pavements are in “good” condition. At the time of assessment, the overall system condition, based on an average of all segments (85.95) was “good”. Less than 1 mile of highway was assessed to be in “poor” condition (Figure 3), 4.4 miles were in “fair” and 45 miles were in “good” condition.

FIGURE 3: PAVEMENT CONDITION CATEGORIES BY MILEAGE

7.0 PAVEMENT CONDITON MAP

FIGURE 4: PAVEMENT CONDITON MAP

8.0 PAVEMENT CONDITION FORECASTING & ANALYSIS

NRPC staff used the RSMS analysis software to forecast pavement conditions and anticipate repair expenses over a 10-year planning horizon. The analysis maximizes the use of collected roadway information provides the basis to develop a reasonable budget. It is important to understand that the results of the RSMS forecasting scenario provides repair suggestions for estimated repair costs. In addition, a number of costs were not taken into account through forecasting including: drainage (e.g. ditching, culverts, catch basins, underdrain, etc.), signage, guardrail, sidewalks, utilities, curbing, and pavement markings. NRPC developed the following pavement maintenance forecasting scenario (Figure 5).

FIGURE 5: RSMS FORECASTING SCENARIO

Forecasting Scenario	Overlay 3 miles of road per year
----------------------	----------------------------------

Individual treatments were applied to each road segment based on the PCI, recommended repairs from the analysis software, and feedback from the Town's Road Agent.

A list of common repairs, including preservation, maintenance, and reconstruction options available through the forecasting software are shown on the following in Figure 6.

- FDR w/CaCl₂ & HMA (4")

9.0 SUMMARY OF PAVEMENT MAINTENANCE FORECASTING

A OVERLAY 3 MILES OF ROAD PER YEAR

This FORECASTING scenario used the pavement management methodology that is preferred by Brookline town officials. That is, to overlay three miles of town roads per year. This methodology has been successful in that it has resulted in an average PCI of approximately 86, based on the field data that was gathered for this pilot study.

Once the field data was incorporated into the data base, NRPC staff and the Brookline Road Agent convened to assign repair strategies for each segment of town road. The repair strategies that were used included crack sealing, overlays, patching, pavement preservations and pavement rebuild.

Additionally, it was decided that a PCI of 70 would be maintained over the 10 year planning horizon. It is acknowledged that the statewide study group determined that a PCI of 80 indicates a road in “good” condition. However local conditions (traffic volume, traffic speeds, vehicle mix) suggest that a PCI of 70 is an appropriate goal to shoot for in Brookline.

This scenario resulted in a PCI that remained above 70 for the entire 10-year planning horizon and a level budget during the planning horizon.

The results of this analysis can be found in Appendix A.

APPENDIX A ANALYSIS RESULTS (TABLES)
